FOR QUICK AND POSITIVE FORM ALIGNMENT

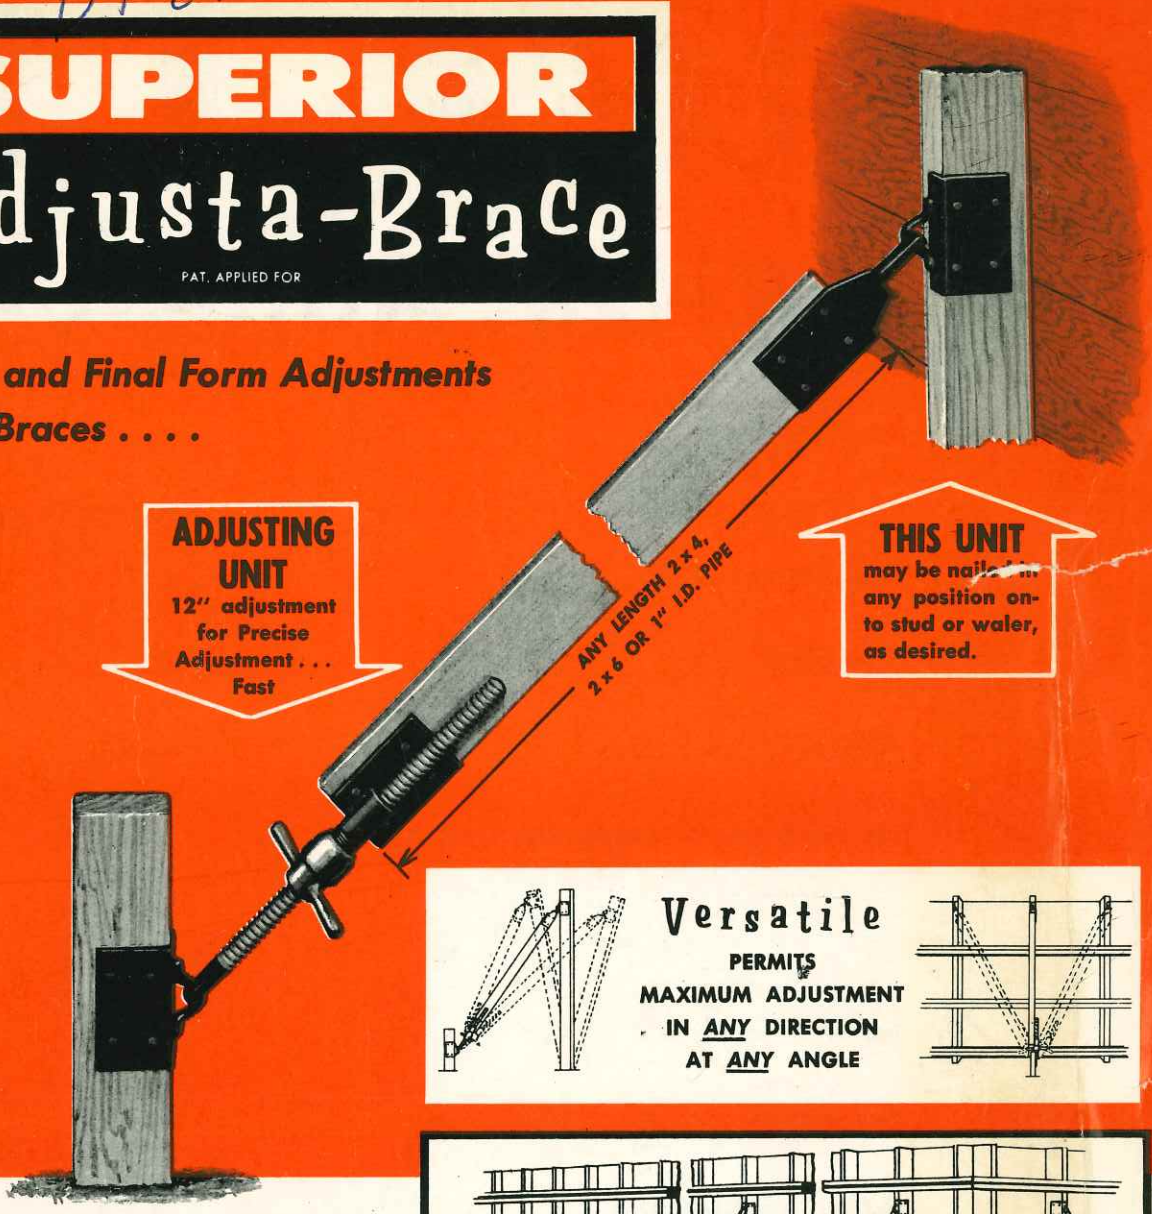
2 5/12 BRACE DIGEST

New!

SUPERIOR Adjusta-Brace

PAT. APPLIED FOR

Permits Preliminary and Final Form Adjustments Without Disturbing Braces . . . .



ASSEMBLY

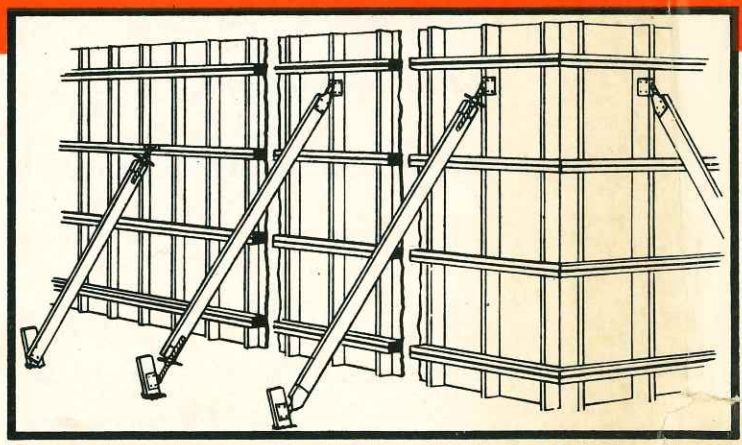
The Adjusta-Brace is assembled by the contractor, usually with a 2 x 4, although a 2 x 6 may be used. If a pipe is preferred, a suitable length of 1" i.d. pipe, threaded at both ends, is screwed into the unit. The Adjusting Unit is interchangeable for pipe or lumber; the other unit must be ordered for use with pipe.

Providing a swivel action for quick positioning and adjustment, the Superior Adjusta-Brace consists of two units, connected by a 2x4, 2x6 or a 1" i.d. pipe. The type for use with lumber is shown in the above illustration. Either unit may be attached to the wall form, or to the stake, as field conditions dictate, but it is usually more convenient to use the Adjusting Unit at the stake. If the contractor prefers, he may use only the Adjusting Unit, nailing the other end of the 2x4 to the stake, although this limits the flexibility of the system.

The Adjusting Unit has a patented double-wing nut, working on a 1" diameter rod. This rod has a special contour thread providing an adjustment of 12". The threads are rolled five to the inch, and are non-clogging. The design of this bracket and the method of attachment are such that it works as a universal joint to take any required position as illustrated in diagram (above, right).

The companion non-adjusting unit of the brace, is also designed so that the nailing bracket will take any position that field conditions may impose.

The Superior Adjusta-Brace is light in weight, durable, and inexpensive. Contractors report a savings in time and labor compared to the conventional method of bracing.



VARIOUS METHODS OF USING SUPERIOR ADJUSTA-BRACE

Nailing brackets may be fastened to stud or wale, and stake.
